

The patch matched the colour.

It still showed.

A product photo came in with the wrong ring on the hand. I wanted to repaint the ring to match the real one so nobody could tell the photo was ever touched. The first try got the ring right and left a faint square around the hand. Here is what the square was, and what made it go away.

How it runs, *top to bottom*.

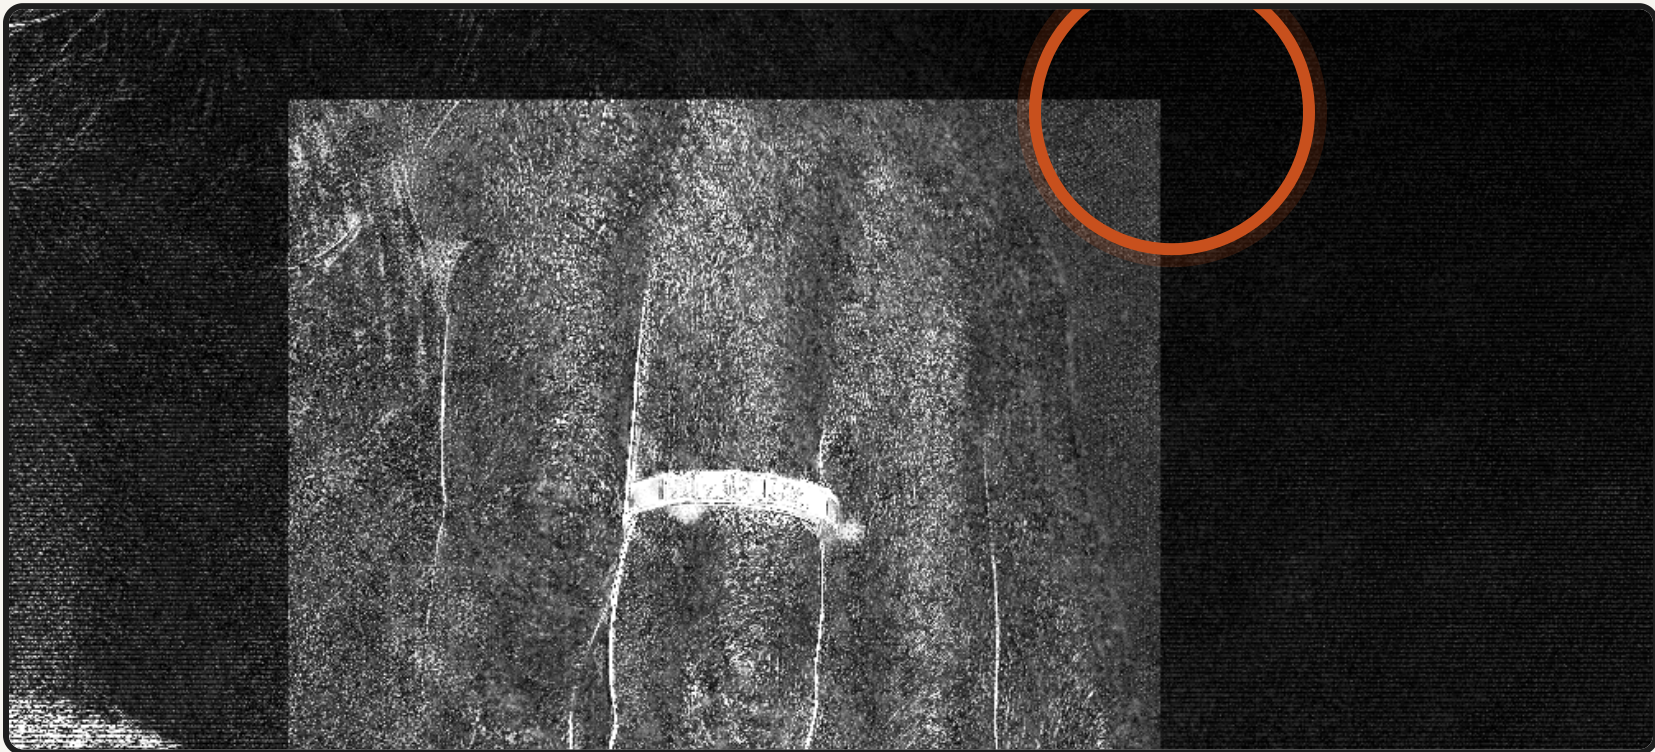

The tool's job is to get the ring right. The edge is the part I control.

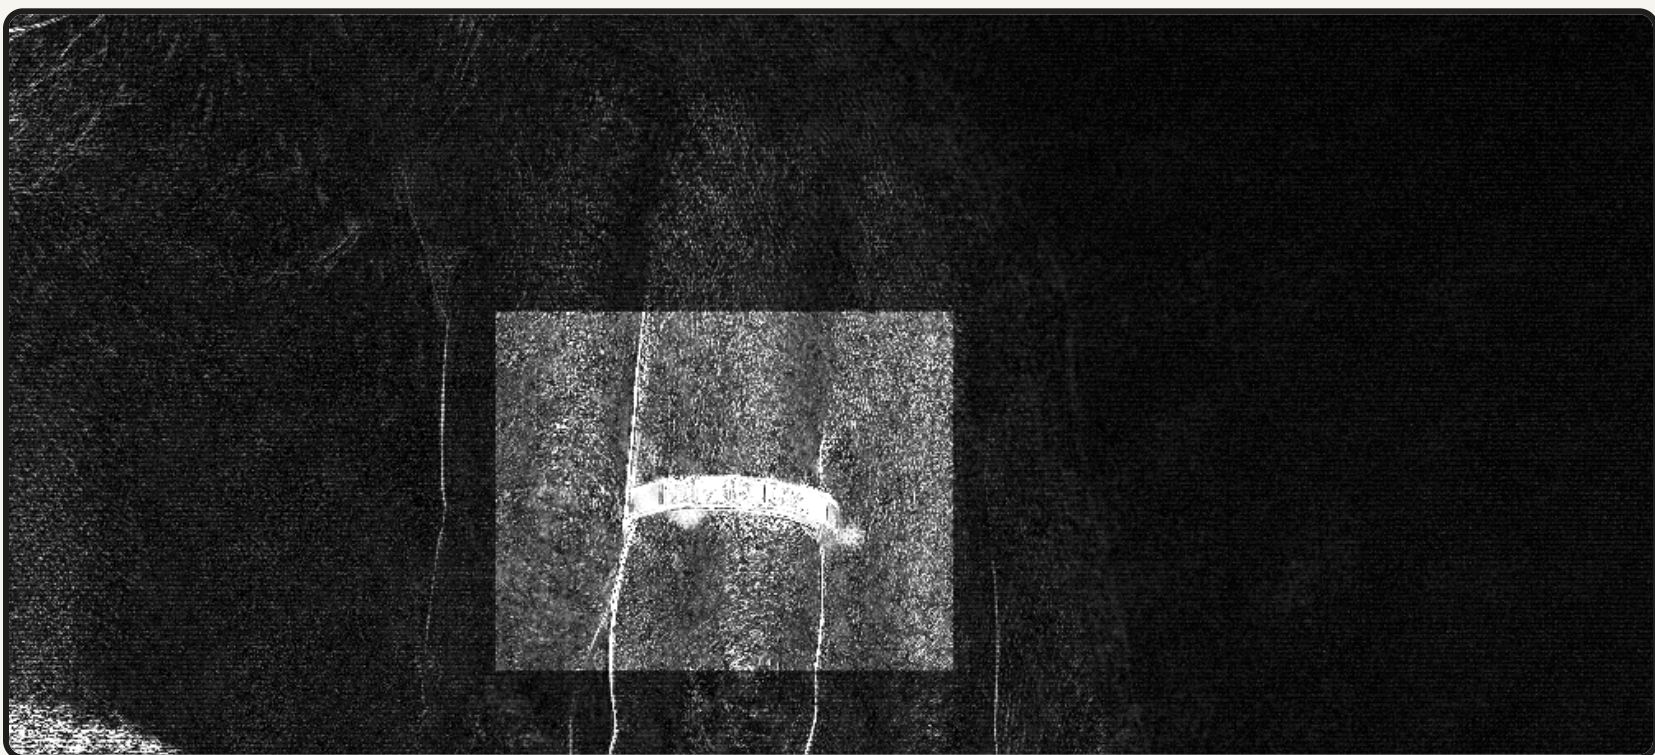

The square, *turned up*.

Each strip is the difference between the original photo and one attempt, turned up until you can see it. White is what changed.

FIRST ATTEMPT. THE WHOLE SQUARE CAME BACK DIFFERENT, SO ITS EDGE SHOWS

AFTER THE FIX. ONLY A SMALL PATCH AROUND THE RING CHANGED, AND ITS EDGE FADES OUT

Matching the colour can't fix this. The problem was never the colour, it's the edge.

Before, *after*.

Left is the photo as it came in. Right is the fixed one. Same hand, same light, same wall, and no square.

All it took was the product photo, the plain photo of the real ring, and a soft edge.
