

The patch matched the colour. *It still showed.*

A product shot comes in with the wrong ring on the hand. The job is to redraw the ring as the real piece and leave everything else alone. The first try got the ring right and left a faint square around the hand where the fix went back in. This is what the square was, and what fixed it.

How it runs, *top to bottom.*

The tool's job is the ring. The edge is mine.

The seam, *boosted*.

Each strip is the difference between the original photo and one attempt, pushed up until you can see it. What is white is what changed.

ATTEMPT ONE. THE WHOLE SQUARE CHANGED, SO ITS EDGE SHOWS

AFTER THE FIX. A PATCH AROUND THE RING, WITH AN EDGE YOU CANNOT SEE

Matching the colour can't fix this. The problem is the edge, not the colour.

Before, *after*.

Left is the photo as it came in. Right is the fixed pass. Same hand, same light, same wall.

One product photo, the packshot, and a soft edge.
